✓ 2071. Application of equivalent circuits of the active quadripole and hexapole type to the calculation of non-linear circuits. P. A. IONKIN. *Elektrichestvo*, 1953, No. 8, 39-43. In Russian.

A graphical method of calculating d.c. circuits with two and three non-linear elements is presented. It is in most cases possible to let the non-linear elements form separate branches and to represent the remaining part of the system by either a 4- or 6-terminal network (active quadripole or hexapole). The latter may then be transformed into, say, T-type equivalent circuits. In the resulting networks the branches containing the non-linear elements will then carry the real currents. The actual a.m.f.'s can then be determined either by calculation or experimentally by simultaneously opening the branches with the non-linear elements, the resistances of the equivalent circuits by the equations of the corresponding passive multipole. The method is fully demonstrated and several numerical examples are worked out.

PERIODICAL: Avtomatika i Telemekhanika, 1957, Vol 18, Nr 6, pp 574 - 577 (U.S.S.R.)  
ABSTRACT: In an article by V.Ye.VARTEL'SKIY, Avtomatika i Telemekhanika, 1940, Nr 2, a method is described for the transformation of a triangle (consisting of nonlinear elements) into an equivalent star. This graphical method contains a grave error. The error consists in the fact that the equations derived here are applicable only to linear electric circuits. For this reason also the results obtained on this basis are not correct.  
A transformation given by the author in "Osnovy elektrotekhniki", part I, published by Gosenergoizdat, 1955 is investigated here. Star-, triangular circuits, and a circuit with a full square is given. It is shown that it is possible by means of a previous transformation of the given circuit in the scheme with series- and parallel circuit of the active and passive nonlinear bipolars,

TITLE: Formulae for Transforming Nonpassive Multi-Node Star Networks  
into Equivalent Polygon Networks. (Formuly preobrazovaniya  
aktivnykh mnogougol'nykh zvezd v ekvivalentnyye mnogougol'niki,  
Russian)  
PERIODICAL: Elektrichestvo, 1957, Nr 8, pp 22 - 26 (U.S.S.R.)  
ABSTRACT: Formulae for transforming multi-ray star networks into an  
equivalent polygon network are often used in the calculation  
and investigation of branched electric circuits. In order to  
obtain these formulae it is sufficient to exclude the potential  
of the common nodal point from the system of node-potential  
equations. A new circuit scheme in form of an equivalent polygon  
will satisfy the system of equations obtained in that manner. The  
formulae for the transformation of two-node, three-node and four-  
node stars into equivalent polygons can be found quite as easily.  
The application of such formulae in many cases substantially  
facilitates the calculation and the analysis of branched cir-  
cuits. Such transformations are shown here for a system with  
a complete two-node star, for a system with a complete and a  
non-complete three-node star. For transformation of the system  
with a four-node star virtually only the formulae for a non-

TITLE: On Computing Non-Linear Circuits by Means of the Iteration Method (O raschete nelineynykh tsepey iteratsionnym sposobom)

PERIODICAL: Elektrichestvo, 1958, Nr 3, pp. 45 - 50 (USSR)

ABSTRACT: Here, a few formulae, which determine the conditions for the convergence of an iteration method in solving the equations of circuits with non-linear elements, are investigated. The computation method for transient and stabilized processes in non-linear circuits is represented here. At first, the diagram with a non-linear element is investigated. Equation (3) - the condition for the convergence - is derived. Equation (6) is derived as a condition for the convergence from another computation scheme. It is shown that for the convergence of the iteration method it is not only important that (3) and (6) are satisfied, but it is important as well to select the correct computation scheme. Then the conditions for the convergence (9) and (10) are derived according to a further computation scheme. At a positive dynamic resistance  $r_d(U)$

Card 1/2

105-58-5-11/31

On Computing Non-Linear Circuits by Means of the Iteration Method

the latter is satisfied independent from the value of the constant resistance  $r$ . Thereafter the convergence conditions for an iteration method for the solving of the equations of a ramified circuit with two non-linear elements are investigated, and the conditions for the convergence are found. Circuits with more than two non-linear elements are treated in the same manner, and the formulae analogous to the equations (9) and (10) are found. Next, the computation method of non-linear circuits with non-sinoidal currents and voltages are investigated. Finally, it is shown by means of a concrete example that this iteration method can be used for the purpose of computing transient as well as already stabilized processes in circuits with non-inert, non-linear elements. There are 7 figures and 7 references, **all Soviet**.

TITLE: Computation of Transient Processes in Linear Systems  
(Raschet perekhodnykh protsessov v lineynykh sistemakh)

PERIODICAL: Elektrichestvo, 1958, Nr 10, pp 1 - 7 (USSR)

ABSTRACT: This is a presentation of two approximation methods for the computation of transient processes in circuits with linear circuit elements. They are based upon the use of integrals with a variable upper limit and are derived either from the principle of rectangular or of trapezoidal interpolation (Ref 1). Both methods are examined by applying them to a network specified by a third order linear differential equation (1), the boundary conditions of which are variable. The first method gives a more general approach to the problem, whereas the second one is less complicated. In the second method the system of linear integro-differential equations (11) is not reduced to an equation of higher order with one unknown but after one integration the wanted unknowns are immediately determined from the system of algebraic

Card 1/3

A Computation of Transient Processes in Linear Systems SOV/105-58-10-1/28

equations. It is shown that integration by trapezoidal interpolation practically gives results equal to those obtained by analytical methods. The numerical integration by rectangular interpolation leads to errors. A deficiency of the method presented, and of similar methods (as such by V. Volynkin (Ref 5), method of recurrent formulae (Ref 3), etc.) consists of the circumstance that when starting the computation the interval  $\tau$  is unknown and must be arbitrarily assumed in order to attain a sufficient accuracy.  $\tau$  denotes the distance of the first ordinate  $y_{(1)}$  along the  $x$  axis from the initial value  $y_{(0)}$  of the curve describing the transient process. This method can also be used in the computation of networks with non-linear circuit elements. There are 5 figures, 1 table, and 6 references, which are Soviet.

TITLE: Topological analysis of electric networks

SOURCE: Elektrichestvo, no. 4, 1964, 59-66

TOPIC TAGS: topological analysis, electric circuit, electric network, electric network topological analysis, electronic component network

ABSTRACT: Classical methods of electric-network calculation, based on Kirchhoff's laws and loop currents and node voltages, are cumbersome and time-consuming. Matrix methods often involve long computations. The article sets forth the fundamentals of a better, topological method of network analysis as developed by S. J. Mason (Proc. IRE, 1953, v. 41, no. 9; 1956, v. 44, no. 7; 1957, v. 45, no. 6). These points are discussed: determinant expansion; topological methods of calculating the network determinant; topological law of

Periodical : Dok. AN SSSR 101/4, 637-639, Apr 1, 1955

Abstract : A description of a high-voltage electrostatic generator of the Van de Graaf type is presented. The generator is operated at a gas mixture (nitrogen and CO<sub>2</sub>) compressed up to 8 atmospheres, and it supplies 2.8 Mv energy. Due to a good focusing device, a narrow (1 mm) beam of ions with 80 mu a current can be obtained at the out-put of the generator. Two USSR references (1955). Diagram.

TITLE: Light concrete with natural fillers in prestressed curved constructions with bar reinforcement

SOURCE: AN ArmSSR. Izvestiya. Seriya tekhnicheskikh nauk, v. 18, no. 6, 1965, 50-56

TOPIC TAGS: concrete, prestressed concrete, reinforced concrete, material deformation

ABSTRACT: This article is a description of a study of complex problems concerning design for and use of prestressed curved elements of high-strength light concretes with natural fillers and high-strength bar reinforcement. Concretes with a lithoidopumice filler of the Lusavanskiy region and a perlite filler of the Aragatskiy region, Armenian SSR, were used in the study. Type 500 Portland cement of the Ararat plant was used as the binding agent. The tests were conducted on beams having a rectangular cross section 12 x 18 cm and 260 cm long, reinforced with two types of bars: 2  $\phi$  12 AIV St 25G2S and 2  $\phi$  6.5AIII St. 25G2S. A total of nine different concrete mixes was tested; the mix component percentages of each mix are given. Tests were performed to measure the bonding anchorage strength as it varies with deflection, and comparative plots are shown for several test mixes. Sixty-day deformation tests were performed for several mixes for the purpose of relating the variation of the

Card 1/2

creep and slump deformation with time. A summary table is given showing the test results, including the characteristics of reinforcement tightening, shrinkage stress in the concrete at the lower level of reinforcement, creep and slump deformation, test duration, and temperature-humidity data from the test period. This work was done under the guidance of Professor A. A. Gvozdev. Orig. art. has: 2 tables and 2 figures.

TITLE: Electronic Level Signaling Device ЭСУ-1 (ESU-I) in Refrigerators on Board Ship

PERIODICAL: Kholodil'naya tekhnika, 1960, No. 6, pp. 52-53

TEXT: The ESU-1 electronic level signaling device is used for keeping the filling-up of apparatus under control. Its performance is based on the change of electric capacity depending upon the level of the medium to be measured. The ESU-1 devices have been installed for the first time in freezers on board ship of large trawlers. In the evaporators, intermediate reservoirs and batteries of direct evaporation where vigorous boiling of ammonia causes drops of saturated vapors and particles of liquid to hit the electrodes, it happens that these emit false signals. As a remedy the authors have developed a protective device as shown on diagrams 1, 2 and 3 which consists of a guard covering the electrode. It is equipped with a tube connecting at one end with the vapor space and at the other end with the liquid medium. In order to increase the dependability of the control,

S/066/60/000/006/008/009 ✓  
A053/A029

Electronic Level Signaling Device 3CX-I (ESU-I) in Refrigerators on Board Ship

on each of the four liquid separators two electronic level signaling devices are installed, viz., an upper and a lower device. The latter prevents liquid ammonia from getting into the liquid separator by closing a solenoid valve on the liquid ammonia supply line leading to the air coolers. As soon as the compressor has drawn off the ammonia excess and the level becomes normal, the solenoid valve opens and liquid ammonia enters the air cooler. The upper device cuts out the compressor as soon as liquid ammonia touches its electrode. There are 3 diagrams.

ORG: Kaliningrad Base of the Maritime Fishing Fleet (Kaliningradskaya baza okeanicheskogo rybolovnogo flota)

TITLE: Cooling unit on the "Priboy" and "Krymskiye gory" refrigerated cargo vessels

SOURCE: Kholodil'naya tekhnika, no. 6, 1966, 21-23

TOPIC TAGS: marine equipment, refrigerating system, ammonia, food preservation

ABSTRACT: The author describes the ammonia refrigeration equipment with brine cooling system used in the cargo holds of the "Priboy" and "Krymskiye gory" refrigerator ships. In addition to cooling the 12,500 m<sup>3</sup> of storage space, the refrigeration equipment is also used for air-conditioning purposes. The refrigeration unit consists of 4 SMC4-180 ammonia V-compressors with a cold-producing capacity of 250,000 kcal/hr each at a boiling temperature of -16°C and a condensation temperature of 34°C and 3 S-64 screw compressors with a cold-producing capacity of 185,000 kcal/hr each at a boiling temperature of -44°C. Three of the piston compressors act as the high-pressure stage of a two-stage cooling installation for the cargo holds, while the fourth is the air-conditioning unit and simultaneously a stand-by unit for the other three compressors. The S-64 screw compressors act as the low-pressure stage of the cooling installation. The

pressure and temperature controls are briefly described as well as the various protectors. The new equipment maintains a temperature as low as  $-30^{\circ}\text{C}$  in the cargo holds. The equipment operated continuously on the first run of the "Priboy" in the northwest and middle Atlantic, maintaining the necessary temperatures in the holds. Orig. art. has: 3 figures.
